Auditing grouped representations

Repeated units can inflate evaluation

Declare the evaluation target

Unit and independent group identifiers
Encoder training data and probe folds

Report separate measurements

Unit holdout and group holdout
Label association and identity decoding
Retained signal and downstream utility

Interpret the intervention

LDI is a label-association reference
Low LDI does not prove identity removal
Fixed-scale overlap does not guarantee a dose

Evidence scope

ST: controls and biological readouts
HAR and gas drift: exploratory audits
No demonstrated downstream benefit
